SUMMARY REPORT

DS ADC 2104

Dentistry is quickly modernizing and transitioning to digital technology. In the past, taking dental impression, making dental models, and assembling dental laboratory prostheses took a lot of time. However, the advent of the intraoral scanner, digital radiography, computer-aided design (CAD)/computer-aided manufacturing (CAM), 3D printers, and artificial intelligence (AI) software revolutionized the field of dentistry as we know it today. Precision and accuracy are two of digital dentistry's key benefits. Cone beam computed tomography (CBCT) and digital radiography are two examples of digital imaging technologies that enable dentists to get extremely precise and detailed pictures of the teeth and surrounding tissues. The utilization of these data allows for very precise and predictable treatment planning and execution. The effectiveness and quickness with which dental restorations may be made is another advantage of digital dentistry
